

Build snapshots on a big machine: 10× faster, same quality

Spring Boot, JVM pinned to the 0.25-vCPU serving shape; n = 20 per cell (exp-b)

Served at 0.25 vCPU, a snapshot primed at 4 vCPU is as good as one primed at 0.25 vCPU (0.98×, 1.02×) when the JVM is pinned. Not pinned, it is 11-17% worse.
